## SILOPATCH

Silopatches are designed to repair any physical damage to Silostop films. The unique oxygen barrier properties of Silopatches ensure maximum protection to your silage. They are on a roll so can either be used individually by tearing along the perforated border or as a continuous tape to seal multiple overlapping silage sheets together. The adhesive glue is very strong so that it can be applied in all weather conditions.

## RECOMMENDATIONS

Holes in any silage film will let air into the silage resulting in spoilage, undoing the time and effort put into covering the silage. Holes in film can be caused at any stage of ensiling. Film can be damaged by operators and equipment. Rodents and birds can make holes in silage sheets during storage, causing spoilage to valuable silage, reducing feed value productivity.

Check all silage films regularly, especially after any handling or moving

Make sure the film is as dry and dust free as possible before applying Silopatches

Check for vermin and bird damage and repair immediately

Peel as many Silopatches off the roll as will be needed to cover the hole
